                                                                                                                                                                                             This DNA sequence is a 6.8 kB PstI fragment isolated from Streptomyces glaucescens GLA.O and encodes the genes, acbA, acbB, acbD, acbD, acbE which are involved in the acarbose biosynthesis pathway. These genes and encoded enzymes are useful for producing acarbose, which is an alpha -amylase inhibitor useful in the treatment of diabetes.

ABL50555 to ABL50562 represent contigs 1 to 8 from the Micromonospora carbonacea everninomicin biosynthetic locus gene cluster. The contigs encode the protein sequences designated ORF (open reading frame) 1 to 49, given in ABB06881 to ABB06930. The gene cluster is useful for the construction of the everninomicin antibiotic in overproducing strains, and to allow chemical modifications of everninomicin to enhance certain properties via genetic manipulation or combinational biosynthesis. The gene cluster can be used to produce genetic systems and genes encoding novel enzyme activities, and avoid the problems of low yield and quality of everninomicins produced by chemical synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               11215

         This invention describes novel nucleic acid sequences from Actinoplanes sp. SE50/110 (CBS 614.71) designated acbb, B. C. D. E, F, G. H. J. K. L. M. N. O. P. O. R. S. U. V. W. X. Y and Z. and asp3.1, 3.2 and 3.3, and their homologues. The products of the invention individually or collectively, are used for synthesis or bioconversion of acarbose (or its precursors or related substances with appha-glucosidase inhibiting activity), especially of alpha-glucosidase inhibitors. The products can also be used for optimising/inducing production of such compounds in Actinoplanes or other organisms. This sequence represents a DNA fragment which encodes the genes involved in the acarbose biosynthesis and bloconversion pathway which are described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5099

                                                                                                                                                                                                                                                                                                                                                                                 ï
                                                                                              This invention describes novel nucleic acid sequences from Actinoplanes sp. SE50/10 (CBS 614.71) designated acba, B, C, D, E, F, G, H, I, J, K, L, M, M, O, P, Q, R, S, U, V, W, X, Y and Z, and asp3.1, 3.2 and 3.3, and their homologues. The products of the invention individually or collectively, are used for synthesis or bioconversion of acarbose (or its precursors or related substances with alpha-glucosidase inhibiting activity), especially of alpha-glucosidase inhibitors. The products can also be used for optimising/inducing production of such compounds in Actinoplanes or other organisms. This sequence encodes a protein involved in the acarbose biosynthesis and bioconversion pathway which is described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                 1140

The cosmid contains open reading frames which encode the various modules of the narbonolide polyketide synthase (PKS). The invention relates to recombinant DNA containing a coding sequence for a narbonolide PKS. Crecombinant DNA containing a synthasised from 2-carbon units through a polyketides are compounds synthesised from 2-carbon units through a responsible for the production of many antibiotics including picromycin. The narbonolide PKS consists of a loading module, six extender modules, and two thiosester domains. Four proteins make up the narbonolide PKS and extender modules 1 and 2, PICAII includes the loading module of and extender modules a protein a proximal includes extender module 5 and approximation is found on the PICAIV. PICAII includes extender module 6 and a type II thioseterase domain. The second type II thioseterase domain. The second type II thioseterase domain is found on the PICB protein. The nucleotide sequences encoding contains from the protein and protein in recombinant form from the recombinant cosmid pkOS003-27. Nat be desosaminyl transferase enzyme is required for this conversion, and the desosaminyl transferase enzyme is used to express, in transformed cells, narbonolide (or its derivatives) cor other ketolides (particularly phylids), which may then be converted to converted or other retaymes recombinantly expressed in the same hosts) to polyketide antibiotics or their intermediates. The antibiotics are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   13;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is used to produce the recombinant DNA compounds of the invention. The specification describes a recombinant DNA compound expressing recombinant polyketide synthase genes in host cells for the production of narbonolide, narbonolide derivatives and polyketides that are useful as antibiotics and as intermediates in the synthesis of compounds with pharmaceutical value. The DNA compounds may also encode
                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleotide sequence of ORF14 which encodes dNDP-glucose 4,6-dehydratase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New recombinant pick hydroxylase gene of Streptomyces venezuelae useful for converting ketolides to antibiotics and as antibiotics and intermediates in the synthesis of compounds with pharmaceutical value
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polyketide;

a C12-hydroxyalse (picK), desosamine biosynthesis and desosaminyl transferase enzymes (useful for conversion of ketolides to antiblotics), and the beta-divcosidase enzyme (involved in picromycin biosynthesis). These compounds are also useful for increasing the antibiotic activity of a compound relative to the unhydroxylated compound. The recombinant host calls are useful as genetic systems that allow rapid engineering of the narbonolide polyketide synthase. These would be valuable for creating novel ketolide analogs for pharmaceutical applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 3099

Comportating a desosanthe biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster, or fragments thereof. The macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin, plkromycin, neomethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methymycin, plkromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful for synthesis of methymycin, plkromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antibiotics and polyhydroxyalkanoate (PHA) custiul propagane novel antibiotics and polyhydroxyalkanoate (PHA) as biopolymers, e.g., in packaging or biomedical applications, to engineer PHA monomer synthases or to prepare biologically active agents, such as chemotherapeutics, immunosuppressants, agents to treat asthma, chronic obstructive pulmonary disease a well as other diseases involving respiratory inflammation, cholasterol-lowering agents or macrolide controlides antibiotics which are active against a variety of organisms, e.g., charactive a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. The present sequence represents the desosamine blosynthetic gene cluster from Streptomyces venezuelae ATCC 15439.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2505
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2269 TGAAGGCCCTGGTCCTGGCAGGTGGAACCGGCAGCAGACTGAGGCCGTTCACCCACACCG 2328

The invention relates to an isolated and purified nucleic acid segment comprising a desosamine biosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin, pixromycin, neomethymycin, narbomycin or a combination of these compounds. Recombinant or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins constitute synthesis of methymycin, pixromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful for synthesis of methymycin, pixromycin, neomethymycin and narbomycin. The alternative termination of polyketide synthesis may be useful to prepare novel antiblotics and polyhydroxyalkanoate (PHA) compounds produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or biomedical applications, to engineer PHA monomer synthases or to prepare biologically active agents, chronic obstructive pulmonary disease as well as other diseases involving respiratory inflammation, cholesterol-lowering agents or macrolide-based contibutions which are active against a variety of organisms, e.g., chronic obstructive pulmonary disease as well as other diseases involving respiratory pathogens, as well as viral parasitic pathogens, or as crop protecrion agents (e.g., funglicides or insecticides) via expression of polyketides in plants. The present sequence represents the desosamine biosynthetic gene cluster (pkk) from Streptomyces venezuelae ATCC to biosynthetic gene cluster (pkk) from Streptomyces venezuelae ATCC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              13;

The invention provides a method to alter the sugar structure diversity for a particular metabolite via the recruitment and collaborative action of sugar genes from a variety of sugar biosynthetic pathways to yield a metabolite comprising a non-natural sugar, e.g., a novel glycosylated polyketide. The invention also relates to a modified recombinant bacterial host cell (mRBHC) in which the expression and activity of nucleic acids encoding sugar biosynthetic enzymes has been altered. The mRBHCs may be cultured to produce the modified sugar products, tetracycline, polyene, polyene, polyether, ansamycin or isochromanequinone. The present sequence is Streptomyces venezuelae sugar (desosamine) biosynthetic gene cluster.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modified recombinant bacterial host cells in which the expression and activity of nucleic acids encoding sugar blosynthetic enzymes has been altered, useful for producing metabolites with altered sugar structures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 2002-405171/43.

                                                                                                                                                                                              This sequence encodes a fragment of the Streptomyces glaucescens GLA.O acbb gene which has been generated via PCR. The acbb gene is involved in the acarbose biosynthesis pathway. This gene and other acarbose biosynthesis genes such as those represented in AAT76903 are useful for producing acarbose, which is an alpha -amylase inhibitor useful in the

```
The sequence is that of a 2634 BamHI fragment from Streptomyces notosus which comprises the complete snoT sequence (encoding amphotheronolide B-dTDP-D- mycosaminyl transferase), the snoD sequence (encoding dTDP-D-glucose synthase) and the partial snoM sequence (encoding dTDP-D-glucose synthase) and the partial snoM isolated genes can be used for, the microbial synthesis of hybrid and glycosylated naturalk products in Actinomyces; increasing the secondary metabolite yield in Actinomyces; the isolation of enzymes in biosynthesis and their use in enzymatic synthesis; the glycosylation of capa, by biotransformation in Actinomyces; the identification of structurally and functionally novel genes; and the screening of producers of secondary metabolites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2316 TTCACCCACACGCCGCCAAGCAGCTGCTCCCCATCGCCAACAAGCCCGTGCTCTTCTAC 2375

                                                                                                                                                                                                                                                                                             The present sequence represents the nogalamycin biosynthesis gene cluster isolated from Streptomyces nogalater. Nogalamycin is an anthracycline antibiotic, so the nogalamycin biosynthetic pathway is also known as the anthracycline biosynthetic pathway. DNA fragments, plasmids and process from the present invention are useful for obtaining novel hybrid antibiotics, such as anthracyclines (antitumour antibiotics)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3482
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3542

                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel method nucleic acid (I) and its encoded copypeptide (II) containing at least one region that encodes an enzymatic polypeptide (II) containing at least one region that encodes an enzymatic activity involved in biosynthesis of spinosyns. (I) are used (I) to containing the or modulate genes involved in the biosynthesis of identify, inactivate or modulate genes involved in the biosynthesis of containing forosamine or trimethylrhamnose to a spinosyn or polyketide synthases, which are used for production of the corresponding contains, including production of (II), their precursors or derivatives, including production of transgenic plants that express of derivatives, including production of transgenic plants that express of and thus have increased resistance to insects. (I) are also useful as marchides with insecticidal, but not antibacterial, activity, and can calso be used to raise specific antibodies, useful for identifying contains to cones in a gene bank. Cells transformed with (I) may produce contains a significantly increased levels or produce new derivatives of contine in the sequence, organization or spinosa genome. (II) at significantly increased levels or produce new derivatives of control or contains the sequence. ORF 23, encodes an S. spinosa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3518 GACGIGIGCGACACCGCGCTCGTCGACACGCTGGCCGCGCGCGCACGACGACATCGTGCAC 3577

This sequence is a DNA fragment of Saccharopolyspora spinosa, containing two genes involved in Rhamnose production. There are four enzymes involved in Rhamnose production. There are four enzymes involved in Rhamnose production. There are four he first is a glucose thymidylate transferase (gtt:AAY39322), the second is glucose dehydratase (gdh:AAX39320), the third is an epimerase (epi:AAX39323) and the fourth a ketoreductase (kre:AAX39321). Kre and gdh genes are found in this sequence. These four enzymes are used during the second in this sequence. These four enzymes or used during the control or spinosyns are insecticidal microlides which are useful for the control of arachnids, nematodes and insects. Blosynthesis of spinosyns occurs via stepwise condensation and modification of carboxylic acid precursors generating a linear polyketide which is modified further. The DNA sequence AAZ21501 contains 24 genes and open reading frames involved in spinosyn biosynthesis, ady39297-439319. The genes identified in S. C. Spinosa as harding a role in the production of spinosyns are useful to improve yields of spinosyns, and for creating new spinosyns e.g. mutagenesis, or interruption of steps in spinosyn biosynthesis. The conditional disconditional modification and the creation of new semi-synthetic spinosyns. He genes are also useful to isolate similar sequences from S. spinosa or other species by hybridization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New spinosyn biosynthetic genes from Saccharopolyspora spinosa, useful for production of insecticidal spinosyn compounds
                                                                                                                                                                                                                                                                                                                                                 Crawford KP, Madduri K, Merlo DJ; Waldron C;

XhOI; This library, constructed by John Davies and Jeffrey
XhOI; This library, constructed by John Davies and Jeffrey
McDermort, combines colNas from cc-1690 cells grown to
mid-log phase in TAP (acetate-containing) medium in the
light, TAP medium in the dark, HS (minimal) medium in the
light, TAP medium in the dark, HS (minimal) medium in
ambient levels of CO2 and HS medium bubbled with 5% CO2
PolyA mRNA was purified from each sample, pooled and cDNA
synthesized. The CDNA was directionally cloned and cDNA
SAP II (Stratageme) in the EcoRNI (5') and XNOI (3') sites
pBluescript II SK- plasmids were excised from the lambda
ZAP clones by superinfection with Exassist (Stratageme)
phage. The library was normalized using method 4 described
in Bonaldo et al (1996) Genome Research 6: 791-806."
